

Final project proposal

Project: Interactive Calendar

For our project we want to build an interactive calendar using Python and Google API to save the entry in the Google calendar using his Gmail address.

The calendar will be use for time assignment. By example a student will output his homework and estimate how time he wants to spent on it, and the calendar will calculate and insert it depending on the schedule. With the possibility to rearrange if needed, and get reminders.

The calendar will be also able to add event using speech recognition.
